

Pellet Tray for .177 Air Arms S400 Rifle.

Fitting the pellet tray will improve the ease of which pellets will slide in to the breech when using the rifle 'single-shot' and 'multi-shot'

Thoroughly de-grease the pellet loading groove in front of the breech with a tissue / cotton bud and a small amount of de-greaser / solvent.
You will find a small piece of 'blue-tac' stuck in the centre of the tray. Use an allen key or match stick stuck in to the 'blue-tac' to assist picking up and positioning the tray. See photo

Take your time with this step.

Try a practice run with the paper backing still attached. When ready, remove the protective paper from the adhesive backed pellet tray.

Cock the rifle – take extra care here, ensuring the safety catch is on, if fitted.

Carefully align the tray with the groove and press it firmly in to position as shown in the photo, making sure the tray does not protrude above the side of the pellet groove

Remove the 'blue-tac' when finished.

The self-adhesive is a temporary measure for testing and setting up. For a permanent fitting which is advised, the self-adhesive can be removed and the tray fitted with a small dab of epoxy or superglue. Note If your rifle is under 12 months old this may invalidate your warranty.
